16 mod experience {
17     /// University of Alberta, Department of Family Medicine                                Edmonton, AB
18     pub fn software_developer() -> Role { // Apr 2025 - Present
19         - Designed, deployed, and maintained a Flask/SQLite application serving as the
20           internal system-of-record and HR management platform for the department's
21           clinical faculty complement.
22         - Developing a clinic analytics platform: SQL Server database, C# ASP.NET Core MVC
23           application, Razor/JS frontend, Python ETL pipelines, and AI-assisted querying,
24           serving multiple clinic sites.
25         - Designed and built a SQL Server system with temporal tables for tracking
26           historical data changes and point-in-time analysis; built Python and SQL ETL/ELT
27           pipelines to migrate legacy spreadsheet and SharePoint data.
28         - Designed an English-to-SQL layer: Gemini's API turns executive questions into SQL
29           run against a fully isolated read-only replica; ScriptDom AST-parses the generated
30           SQL to reject non-SELECT query patterns.
31         - Gathered requirements from non-technical stakeholders: led a workshop for 16
32           end-users, observed clinic staff workflows on-site, delivered technical design docs.
33     }
34
35     pub fn research_assistant() -> Role { // May 2025 - Jul 2025
36         - Managed design, data collection, and analysis of a reporting-system usability study.
37         - Implemented PDF report generation and statistical analysis (ordinal logistic
38           regression, sign tests, Cronbach's  $\alpha$ , PCA).
39         - Adapted the System Usability Scale for domain context; wrote technical report; lead
40           author on poster (ACFP 2026); oral presenter at 2026 FM Research Day.
41     }
42
43     pub fn program_assistant() -> Role { // Sep 2022 - Apr 2025
44         - Prototyped a Gemini API de-identification tool; automated admin tasks in Python/JS.
45     }
46 }
47
48 mod projects {
49     /// An adversarial Rubik's cube | source                                Rust, TypeScript
50     pub fn evil_cube() -> Project {
51         - Scrambles itself if the user gets too close to solving it.
52         - Implemented BFS in Rust to generate a corner pattern database, used with Korf's
53           algorithm to estimate solve distances.
54         - Implemented a 3D Rubik's cube in TypeScript and Three.js with quaternion rotations.
55         - Followed OOP principles, organizing the frontend into modules behind a shared API.
56     }
57
58     /// Contributor to Bevy Engine                                Rust
59     pub fn open_source_contributions() -> Project {
60         - Migrating engine examples to the new Feathers widget set.
61     }
62
63     /// Front page of Hacker News, Jan 2026 | try it here                JavaScript, React
64     pub fn synesthesia() -> Project {
65         - Color-picker sonification tool. Answers the all-important, widely-asked question:
66           'What does a color-picker sound like?'
67         - Designed an algorithm mapping hexcodes to chords in 24-tone equal temperament.
68         - Wrote bit-twiddling transformation logic to implement hexcode-to-chord morphisms.
69         - Implemented realtime audio synthesis with ADSR envelopes using Tone.js.
70         - Used React hooks (memos, refs) to reuse Tone.js nodes, avoiding per-render rebuilds.
71     }
72 }

```
